I. INTRODUCTION

To determine general effects of fluid injection into a turbulent boundary layer on missile drag and stabilizing forces at angle of attack, an exploratory investigation was made at Mach 1.63 and 2.2. The test model was a body of revolution 10-cal long with a 3-cal tangent ogive nose and stabilizing fins. The mass injection was simulated by nitrogen and injected into the boundary layer from a porous section just aft of the nose body junction. The porous section was varied in length from 0.5 to 1.5 cal. Angle of attack range varied from -3.5° to $+19^{\circ}$.

II. APPARATUS AND PROCEDURE

The tests were conducted in the Jet Propulsion Laboratory (JPL) 20-in. supersonic wind tunnel. The tunnel was run at Mach 1.63 and 2.2, with a wind-off total pressure of 14 psi.

A diagram of the model as installed for testing is shown in Figure 1. The model is a body of revolution 1.375-in. in diameter with a 3-cal tangent ogive nose and a 7-cal cylindrical afterbody. Three changeable centerbodies with 0.5, 1.0, and 1.5 cal cutouts with stainless steel mesh of 0.36 porosity were used for mass injection sections. Nitrogen was supplied through the sting and channeled through the center of the balance around an air deflector and through the stainless steel mesh. Mass injection rates varied from 1.68 \times 10 $^{-5}$ 1b/sec to 67.2×10^{-5} 1b/sec. Turbulent flow was obtained by a boundary layer trip at the model nose. Reynolds numbers varied from 2.5 \times 10 5 to 3.0 \times 10 5 . The model had four rectangular tail surfaces, 1-cal long and 0.5-cal high, with the leading edge located at station 12.375 in. from the nose. The model was tested in the X fin configuration.

Base pressure data from one base pressure tap was obtained at M = 1.63. Force data were obtained by a six component strain gage balance. Effects of bleed on the model C_N , C_M , C_Y , C_n , C_ℓ , and C_K were investigated by varying the mass injection rates F. The mass flow injection data were also compared to a solid body model. Model angle of attack varied from -3.5° to +19°.

III. RESULTS AND DISCUSSION

Figure 2 shows that the effectiveness of mass injection on reducing missile axial force is dependent on the mass injection flow rate, size of the porous section, Mach number, and angle of attack. For the specific set of conditions, M = 2.2, 0.5-cal long, porous

cross section, the flow rate F = 0.004 reduced the axial force coefficient the maximum amount. This was approximately 4% of the total. The mass injection is effective over an angle of attack range of up to 6° .

All other porous sections did not reduce the axial force coefficient. The larger injection sections caused a higher ${\rm C}_{\rm A}$ because of bleed into the cavity. At the lower Mach number (M = 1.63), there was no reductions in ${\rm C}_{\rm A}$ for any of the injection rates. The effects of the mass injection on the other missile force coefficients at low angle of attack α < 6° are negligible as shown in Figure 3 for F = 0.004.

A plot of C_A versus F (Figure 4a) at M = 2.2, for configuration 705, shows that as the mass injection into the boundary layer is increased there is an initial decrease in the axial force coefficient. The C_A increases as more mass is injected into the boundary layer until the C_A approaches values for the mass injection-off conditions. Each line represents a constant α and values at the left indicate solid body conditions. The data indicated that at approximately F = 0.004 the maximum reduction of axial force coefficient occurs for specific set of conditions. For the lower Mach number, M = 1.63 (Figure 4b), the axial force coefficient is not decreased.

Schlieren's photograph (Figure 5) of the 705-configuration at M = 2.2 and α = 0, indicates for mass injections rates of F = 0, 0.004, the boundary layer has not expanded, and that for mass injection of F = 0.02, the boundary layer is thickened. Also, there is indication that the mass injection is escaping from the boundary layer. A set of Schlieren photos are also presented for α = 18. For the α = 18° case, it is not clear that there is less separation of the boundary layer when there is mass injection in the boundary layer.

A limited comparison of base drag data indicates the mass injection may have and effect on the base drag coefficient. An example of this is shown in Figure 6 for M = 1.63, α = 0, and α = 6°. For the small length grids, there is a reduction in the base drag coefficient at α = 0°. This may or may not be a good indication of influence of the mass flow on the base drag because of the tolerances of accuracy in the base pressure measurement.

Figure 7 shows the component parts of the theoretical axial force coefficient. The bleed effects on longer bodies of revolution can be estimated by using the theoretical body friction drag.

A complete set of tabulated data is presented in the Appendix.

IV. CONCLUSIONS AND RECOMMENDATION

Feasibility -

- a) Insensitive over a mass injection rate from 1 to 8×10^3 . This enables the mass injection mechanism operational tolerance.
- b) Axial force coefficient reduced by 4%, probably would be greater for longer bodies of revolution
- c) Bleed mechanism is dependent on Mach number, bleed chamber size, and bleed rate.
- d) Mass bleed injection effects are not sensitive to small angles of attack of less than 6°.

Recommendation — Mass injection should be investigated further as a possible means of reducing missile drag.

LIST OF SYMBOLS

Alpha, α Angle of attack (deg)

CN, C_N Normal force

CY, $C_{\mathbf{Y}}$ Side force

 ${\tt CA}$, ${\tt C}_{{\tt A}}$ Axial force coefficient

 ${
m CM},~{
m C}_{
m M}$ Pitching moment coefficient measured from the base

CLN, C Yawing moment

CLL, C_{ℓ} Rolling moment

F Dimensionless mass flow rate normal to surface, $\frac{\rho_{\mathbf{w}} \mathbf{v}_{\mathbf{w}}}{\rho_{\mathbf{w}} \mathbf{U}_{\mathbf{w}}}$

Referense area $\frac{\pi D^2}{4} = 1.4849 \text{ in.}^2$

Configuration No. 700 Solid model

705 0.5 caliber porous cylinder 0.36 porosity

710 1 caliber porous cylinder 0.36 porosity

715 1.5 caliber porous cylinder 0.36 porosity

U Velocity component parallel to surface ft/sec.

V Velocity component normal to surface ft/sec.

w Wall

∞ Freestream
